

Udder Health Report - Dry Off & Fresh Monitoring

- January 1, 2020
- Quebec

The *Udder Health Report - Dry Off & Fresh Monitoring* is an key tool to help you better manage your herd's health.

By presenting a portrait of your herd over a 12-month period, this report allows you to see the evolution of your cows' mammary gland infections over time (seasonal infections, infectious trends, etc.).

It is a good general indicator of the status of mammary gland infections for all your cows with SCC values above 200.

Graphs allow you to see the infection status of your herd (number and % of your cows) in relation to the targeted objectives for new infections, chronic infections and total infections.

It is a great tool to help you evaluate your dry-off strategy, manage

calving/post-calving periods and monitor incurable chronic infections.
